

Job offer

CEO promoter

FATRIXGEL PROJECT

The biomaterials used in researching new therapies, and regenerative and customised medicine, do not manage to recreate the micro-environments of native tissues. Fatrixgel is a biomaterial that mimics the extracellular matrix of the native fabrics and, therefore, improves the efficiency of the 3D cell cultures. This is achieved by means of a new patented tissue decellularization process that is fast, cost-effective, scalable and reproducible.

Go to the project

Full-time

**Donostia/San Sebastián
